

Product Information

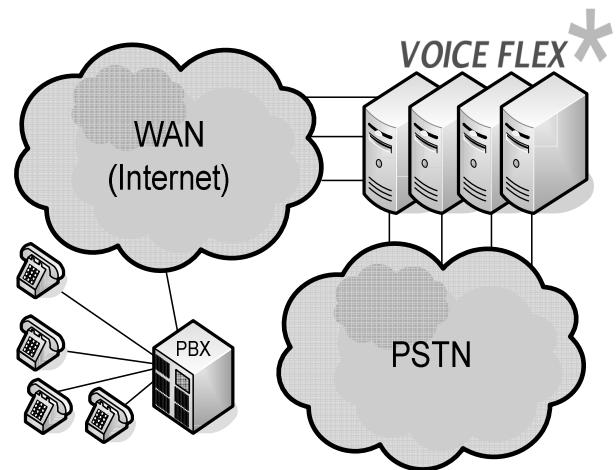

SIP Trunks

SIP (Session Initiation Protocol) is a worldwide protocol used to control telephone calls over IP between devices.

Voiceflex is a VoIP Carrier; we carry telephone calls over the internet, which can be routed end-to-end over the internet or breakout to existing landline or mobile carriers. Voiceflex is a pure B2B service.

SIP Trunks are the next generation, replacing ISDN Trunks. All the leading telephony manufacturers support SIP Trunks.

Voiceflex SIP Trunks operate on any xDSL connection, we don't need a fixed IP address. Our service operates via account verification and password, far more secure and adaptable than a fixed IP address.

Signalling:
Voice:
DTMF:

SIP (RFC 3261). STUN supported.
G.711 μ -law, G.711 a-law, G.729
RFC 2833, SIP INFO

There are a number of benefits over and above ISDN

- Number portability. Move office anywhere and take your present BT telephone number/s with you.
- Out of area numbers. Office in London, but need an Edinburgh number, not a problem. Your SIP connection can be programmed with any number area in the UK and most of Europe and the USA.
- Failover - If ISDN fails or internet connection has an issue, then your business numbers can be automatically redirected.
- Instant provisioning of numbers and lines.
- Call recording non-site based
- Emergency 999 calls supported
- Installation cost nil, rental cost 56% cheaper than ISDN
